

Cinder: complete how-to guide

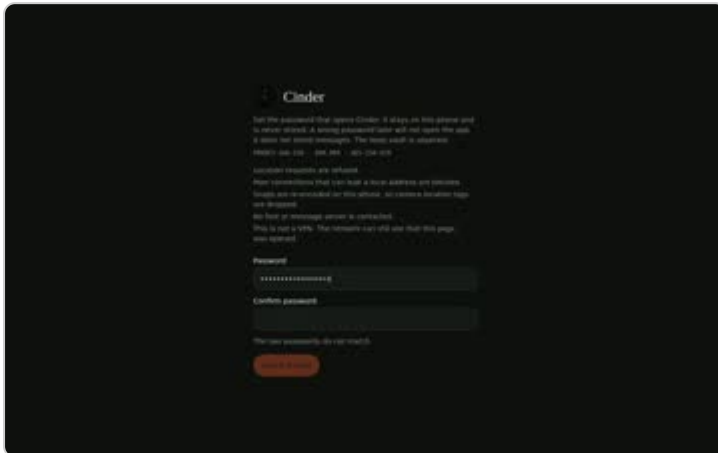

All guides in one document.

Set your launch password

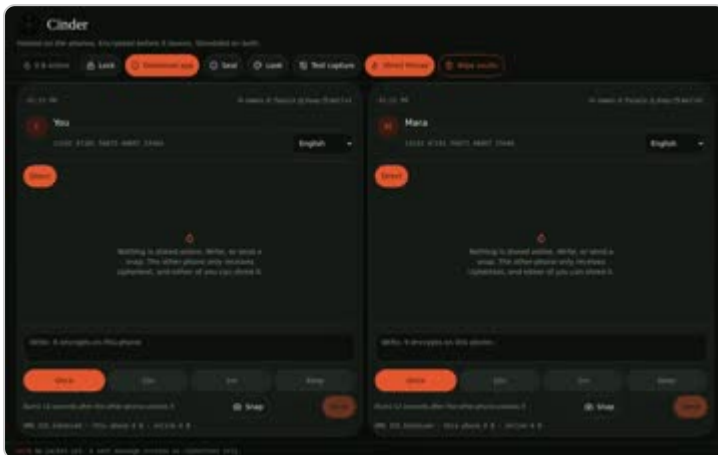

1. Open Cinder. The first screen asks you to create a launch password.
2. Type a strong password. The strength check tells you if it's too weak.
3. Confirm it, then tap **Seal and open**. This password encrypts everything Cinder stores. There is no reset. If you forget it, the data can't be recovered.
4. Next time, enter the same password to unlock. Wrong guesses add a growing delay.

Send and open a sealed note

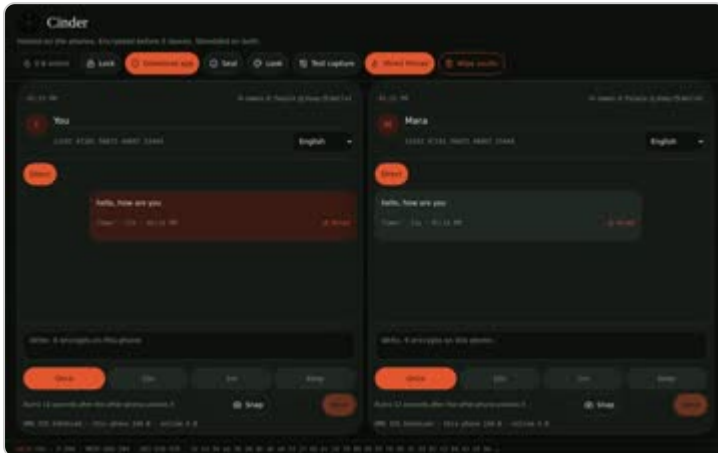

1. Pick a conversation and type your note.
2. Tap send. The note appears as a sealed box.
3. Tap **Unseal on this phone** to read it.
4. *Today both ends of a conversation live on the same device (demo mode). Phone-to-phone delivery is coming soon.*

Translate a message

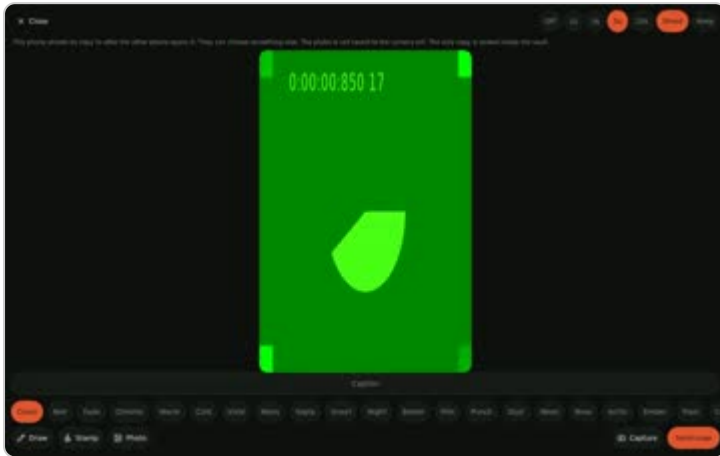

1. Open a received note.
2. Choose translate and pick your language.
3. The translation shows on top and the original stays underneath, so nothing is lost.

Shred messages

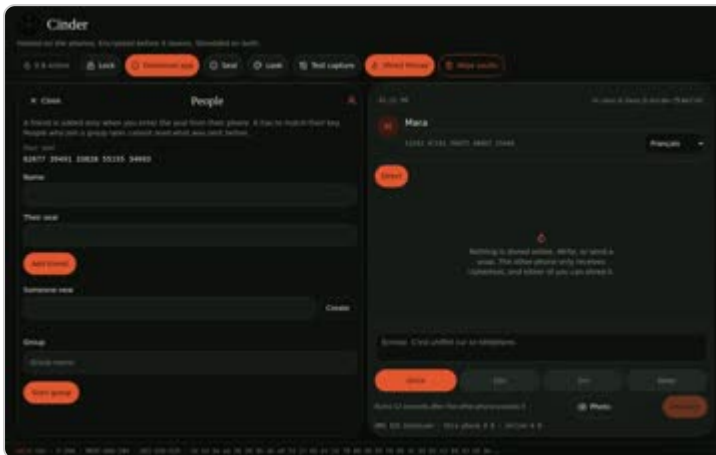

1. Open the message you want gone.
2. Tap **Shred**.
3. It deletes this phone's copy. Shredding on both phones will come with two-phone messaging.

Snap: the in-app camera

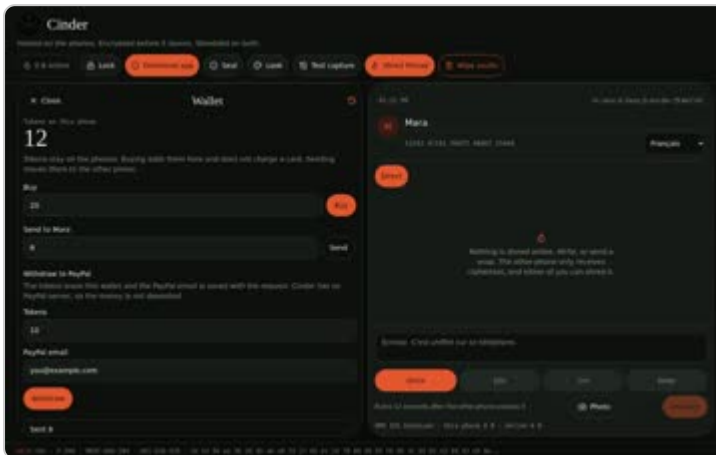

1. Tap **Snap**. Only now does Cinder ask for camera permission.
2. Take a photo and add a filter if you like.
3. Set a burn timer so the snap destroys itself after viewing.
4. Snaps never go to your camera roll. They're re-encoded, so location tags are removed.

People and groups

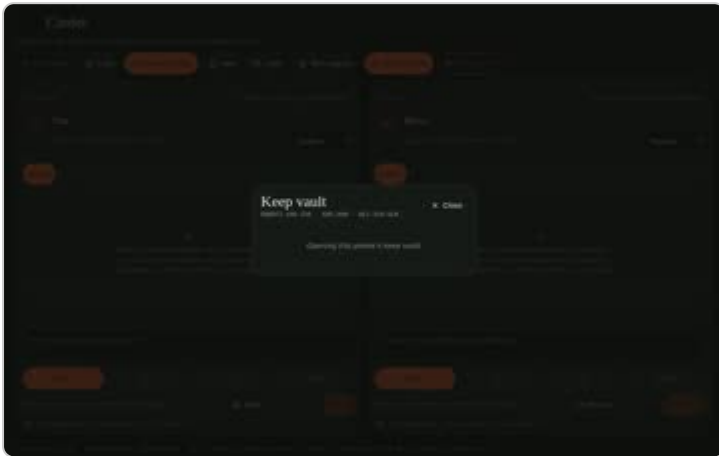

1. Open **People**.
2. Add a friend using their seal.
3. Create a group and add members.
4. People who join later can't read messages sent before they joined.

Games

1. Open **Games**.
2. Choose chess, Crazy Eights or Go Fish.
3. Play against your contact in the conversation.

Keep: the private vault

1. Open **Keep** and set a second, separate password.
2. Store private notes and items inside.
3. Warning: too many wrong tries shred the vault's contents for good.

1. Cinder isn't available to download yet. When it launches, get it from Google Play (Android) or the Download page (Fire tablet).
2. Android: allow your browser or Files app to install unknown apps when asked. Fire: Settings → Security & Privacy → Apps from Unknown Sources, then allow Files or Silk.
3. Open the APK and tap Install. If an old copy won't upgrade, uninstall it first.
4. iPhone and iPad: coming soon.
